SUMMARY

Full-stack developer with production experience shipping banking applications on the Appian platform and four independently deployed projects across Next.js, React, Node.js, Express, PostgreSQL, and TypeScript. Strong CS foundation (Birzeit University) with proficiency in Java, JavaScript, and TypeScript. Open to remote roles internationally and relocation with visa sponsorship.

TECHNICAL SKILLS

Primary: TypeScript, JavaScript, Java, HTML5, CSS3

Frontend: React, Next.js, Tailwind CSS, GSAP, Recharts

Backend: Node.js, Express

Database & ORM: PostgreSQL, Prisma

Auth & Validation: JWT, Zod

APIs & Maps: Mapbox, OpenStreetMap

Enterprise: Appian, SAIL

Tooling & Deploy: Git, Vercel

Familiar with: Python, C, PHP

LANGUAGES

Arabic (Native) **English** (B2 — Professional working proficiency)

EXPERIENCE

Software Developer · **Experts Turnkey Solutions**

Oct 2025 – Present

Production banking applications on Appian for clients including Jordan Kuwait Bank.

- Design SAIL interfaces deployed to branch and back-office staff at a live production bank.
- Write expression rules encoding banking logic, validation, and data transformation against core banking data.
- Model record types and process flows meeting the auditability requirements of regulated financial software.
- Deliver features end-to-end where correctness is a hard requirement, not a preference.

PROJECTS

Roam — Next.js 16 · TypeScript · PostgreSQL · Prisma · Mapbox · GSAP [GitHub](#) · [Live](#)

- Wrote DBSCAN clustering from scratch with haversine distance — radius in real metres, correct at any latitude, replacing off-the-shelf clustering that silently distorts distances near the poles.
- Applied temporal splitting to resolve repeated visits into distinct timestamped stops, preserving trip shape rather than collapsing multiple visits into one point.
- Delivered scroll-driven route animation coupling page scroll position to trip progress via GSAP and Mapbox GL.

TaskFlow — Express · React · TypeScript · PostgreSQL · Zod · JWT [GitHub](#) · [Live](#)

- Applied fractional indexing for card order — reordering any card writes exactly one row, eliminating the cascading renumber that integer positions require.
- Generated OpenAPI docs from the same Zod schemas that validate requests, so documentation and implementation share one source and cannot drift.
- Solved concurrent token-refresh race with a single-flight promise: first 401 triggers refresh, all callers await the same result and retry with the new token.

EDUCATION

BSc Computer Science · **Birzeit University**

2021 – 2025

Coursework: Data Structures, Algorithms, OOP (Java), Database Systems, Operating Systems, Computer Networks, Software Engineering.
